Please find below and/or attached an Office communication concerning this application or proceeding.

**Office Action Summary**

Application No.

09/500,293

Applicant(s)

WOLFE, ROBERT H.

Examiner

Thomas H. Stevens

Art Unit

2123

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

**Status**

- 1) ☒ Responsive to communication(s) filed on 1/22/04. 2b ☐ This action is non-final.
- 2a) ☒ This action is FINAL.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

**Disposition of Claims**

- 4) ☒ Claim(s) 1-37 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 1-37 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

**Application Papers**

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

**Priority under 35 U.S.C. § 119**

- 12) ☐ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).  
a) ☐ All b) ☐ Some \* c) ☐ None of:
1. ☐ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

**DETAILED ACTION**

1. Claims 1-37 have been presented for examination.

***Response to Arguments-Drawing Objections***

2. Applicants' are thanked for their arguments with respect to the drawing objection. The examiner withdraws the objections requiring every drawing must emphasize each significant feature (pg. 3, lines 5-20; and pg. 4 lines 1-12).

***Response to Arguments-Specification Objections***

3. Applicants' are thanked for their arguments with respect to the specification objection. The objections are withdrawn.

***Duty of Disclose***

4. Applicants' response is noted, but not persuasive. It is for the office to determine whether a disclosure is material to the claimed invention. Please provide the article in question in the next response to the office.

***Response to Arguments-Claim Rejections***

5. Applicants' are thanked for their response with respect to claim rejections. The examiner is well aware that under 35 U.S.C. 102 a claim is anticipated only if each and every element as set forth in claim is found, either expressly or inherently described in a single prior art reference. This is precisely why the rejections were structured as in paper six.

The examiner notes ~~with~~ applicants' allegation that Azar does not determine the position or orientation of a component part (pg. 8). This is not persuasive. The feature, in question, is inherent. The fact that Azar scans images or components in order to manipulate their position or orientation via a monitor and computer is inherent. Subsequently, each recorded image is composed of a coordinate system for the computer to accurately and visually display the image. Summarily, Azar encompasses applicant invention. Thus the rejection is therefore maintained.

***Claim Rejections - 35 USC § 102***

6. Claims 1-37 are rejected under 35 U.S.C. 102(b) as being anticipated by Azar (U.S. Patent 5,778,177 (1998)). Numbers within parenthesis represent component or steps found in Azar (1998). Regarding claims 1-37, Azar teaches an interactive device which is to display and manipulate multidimensional images. Figure 2 shows one embodiment of the interactive scanning device and system (10) of the present invention. The interactive scanning device or system (10) includes one or more input devices (11), at least one scanner (12), an image processor (13), comprising of a computer processor (13a) and a CAD storage (13b) for storage of any suitable solid modeling program, an image display (14), and communication interface (15). The input device (11) includes such things as a keyboard (11 a), a mouse (11 b), a touch screen (11 c), or any other device which enables the user of the present invention to interactively display and manipulate a three-dimensional image of an object or surface. (Column 2, lines 26-39)

The scanner (12) includes infrared, radio waves or laser scanning equipment. The scanner may compromise one or more single or multi-dimensional scanners. If only one scanner is used, the object will likely need to be rotated so that the scanner can capture the

Art Unit: 2123

geometrical dimensions of the object or the topological information associated with more than one surface of the object. Alternatively, the object can remain partially or wholly fixed with the use of a plurality of scanners appropriately positioned around the object. (Column 2, lines 49-56)

In operation, the scanner (12) captures the geometrical dimensions of the object and the topological data associated with its surfaces. The data is then, if desired, stored in the device memory or in memory associated with the image processor (13). To ensure image integrity, after scanning, the image is preferably displayed on the image display (14) by way of the image processor (13) and then transmitted over the telecommunication medium (20) to another interactive scanning device (10) or computer station (5) using the same or similar solid modeling software program. At either location, the image can be interactively displayed and manipulated by the user. (Column 3, lines 19-29)

The image processor (13) may include using a CAD program (13b) or other solid modeling software package. The computer processor (13) can be of a variety of devices capable of processing the information obtained by scanning an object or surface, or both, in conjunction with a solid modeling program (e.g., microprocessor, personal computer, computer work station, etc.). (Column 2, lines 55-62)

The solid modeling software package (13b) allows interactive display and manipulation of the scanned objects or surface on the image display (14). The user can communicate about an object or surface and individually, as well as collectively, manipulate the image of the object in the form or rotation, cut and paste and the like. (Column 2, lines 57-67; Column 3, lines 1-5)

Claim 1: A CAD (computer-aided design) system, comprising: a data processing system comprising a CAD application, the CAD application being executed by the data processing

system to generate a CAD model of a physical model, the CAD model comprising a plurality of CAD representations each corresponding to a component part of the physical model; and a tracking system for generating tracker data associated with a given component part, wherein the tracker data is processed by the data processing system to generate a CAD representation of the given component part and determine the position and orientation of the component part with respect to the physical model as the component part is placed in a desired position in the physical model: (As stated by Azar.- column 2, lines 19-67).

Claim 2: The system of claim 1, further comprising a library for storing CAD representations of component parts used for constructing the physical model: (As stated by Azar: column 2, lines 26-34).

Claim 3: The system of claim 2, wherein the tracking system comprises: a stationary tracker source (TS); and a sensor circuit embedded in the given component part for sensing the position of the given component part with respect to the TS and for generating the tracker data, wherein the sensor circuit stores a part identification (ID) code that is transmitted to the data processing system for the CAD application to retrieve a CAD representation from the library based on the part ID code: (As stated by Azar.- column 2, lines 49-67).

Claim 4: The system of claim 2, wherein the tracking system comprises: a stationary tracker source (TS); and a tracker free member (TFM) for sensing its position with respect to the TS and generating the tracker data, wherein the TFM comprises a docking mechanism for connecting the TFM to the given component part at a docking position on the given component part: (As stated by Azar- column 2, lines 10-67).

Claim 5: The system of claim 4, wherein the docking position is one of arbitrary and pre-determined: (As stated by Azar: column 2, lines 49-56).

Claim 6: The system of claim 4, wherein the docking mechanism of the TFM insertably engages a receptacle on the given component part: (As stated by Azar: column 2, lines 49-56).

Claim 7: The system of claim 6, wherein a part ID (identification) of the given component part is encoded by the shape of the receptacle, and wherein the docking mechanism of the TFM senses the shape of the receptacle to identify the part and send a signal to the data processing system to retrieve a CAD representation from the library based on the part ID: (As stated by Azar: column 2 and 3, lines 49-56 and 1-9 respectively).

Claim 8. The system of claim 6, wherein the given component part comprises a microchip having a part ID code, the microchip being electrically coupled to the docking mechanism of the TFM upon connection of the TFM to the given component part so as to transmit the part ID to the data processing system to retrieve a CAD representation from the library based on the part ID: (As stated by Azar- columns 2 and 3, lines 57-59 and 19-24 respectively).

Claim 9: The system of claim 4, wherein the docking mechanism comprises one of a suction device and an adhesion device: (As- stated by Azar: column 2, lines 49-56).

Art Unit: 2123

Claim 10: The system of claim 4, further comprising a marking jig for measuring tracker data of relevant points of the given component part to generate a CAD representation of the given component part: (As stated by Azar- column 2, lines 49-56 and 57-60).

Claim 11: The system of claim 10, wherein the marking jig comprises a fixed reference point: (As stated by Azar- column 2, lines 49-64).

Claim 12. The system of claim 10, wherein the relevant points include at least one corner of the given component part: (As stated by Azar- column 2, lines 49-64).

Claim 13. The system of claim 10, wherein the relevant points include all corners of the given component part: (As stated by Azar: column 3, lines 49-64).

Claim 14. The system of claim 10, wherein the marking jig is configured for measuring tracker data associated with a radius of the given component part: (As stated by Azar: column 3, lines 49-64)

Claim 15. A method for generating a CAD (computer-aided design) model of a corresponding physical model comprising a plurality of component physical parts, the method comprising the steps of generating, a CAD representation of a given component physical part based on relevant points of the component physical part; tracking coordinates of the relevant points of the CAD representation of the component physical part in relation to coordinates of the CAD model as the physical component part is placed in a desired position in the physical model; and adding the CAD representation of component physical part to the CAD model such that the CAD model comprises an ensemble of individual CAD

Art Unit: 2123

representations of component physical parts: (As stated by Azar. column 2 and column 3 lines 19-29).

Claim 16. The method of claim 15, wherein the step of generating a CAD representation of the component physical part comprises the steps of. connecting a tracker free member (TFM) to the component physical part at a docking position on the component physical part; obtaining coordinate data for each of the relevant points of the component physical part; processing the coordinate data for each of the relevant points to determine the position and orientation of each of the relevant points of the component physical part in relation to the TFM: (As stated by Azar- column 2; and column 3 lines 19-29).

Claim 17. The method of claim 16, further comprising the step of rendering an image of the component physical part attached to the TFM using the processed coordinate: (As stated by Azar- column 3 lines 30-36).

Claim 18. The method of claim 16, wherein the step of obtaining coordinate data for each of the relevant points of the component physical part comprises the steps of obtaining a part identification (ID) code associated with the component physical part; and retrieving pre-stored geometry data and docking position data associated with the component physical part based on the part ID code: (As stated by Azar: column 2 lines 49-64).

Art Unit: 2123

Claim 19. The method of claim 18, wherein the step of obtaining a part ID code comprises the steps of insertably engaging a docking mechanism of the TFM with a docking receptacle of the component physical part; encoding the part ID based on a shape of the docking receptacle; sensing the shape of the docking receptacle; and transmitting a corresponding part ID from the TFM based on the sensed shape of the docking receptacle: (As stated by Azar: column 2 lines 10-65).

Claim 20. The method of claim 18, wherein the step of obtaining a part ID code comprises the steps of insertably engaging a docking mechanism of the TFM with a docking receptacle of the component physical part to operatively connect the docking mechanism to a microchip in the component physical part; retrieving the part ID from the microchip; and transmitting the retrieved part ID from the TFM: (As stated by Azar: column 2 lines 26-65).

Claim 21. The method of claim 16, wherein the step of obtaining coordinate data for each of the relevant points of the component physical part comprises the steps of obtaining pre-stored geometry data of the relevant points associated with the component physical part; measuring coordinates of a portion of the relevant points of the component part; comparing the measured coordinates with the pre-stored geometry data; computing the docking position of the TFM on the component physical part, if a match is found between the measured coordinates and the geometry data of corresponding relevant points; determining a remainder

Art Unit: 2123

of the relevant points of the component physical model based on the computed docking position and geometry data: (As stated by Azar.- column 2 lines 10-65).

Claim 22. The method of claim 21, further comprising the steps of\* rendering images of the component physical part each having an alternative docking position, if a match is not found between the measured coordinates and the geometry data; and selecting the image with a desired docking position: (As stated by Azar: column 1 lines 27-46).

Claim 23. The method of claim 16, wherein the step of obtaining coordinate data for each of the relevant points of the component physical part comprises the steps of: measuring the coordinates of successive relevant points of the component part; rendering an image of the component physical part, wherein the image is dynamically generated by connecting a line from a current measured point to a last measured point; and re-connecting the line from the current measured point to any previous measured point, if the rendering of the connection between the current measured point and last measured point is an incorrect depiction of the component physical part: (As stated by Azar.- column 2; and column 3 lines 19-29).

Claim 24. The method of claim 16, wherein the step of processing the coordinate data for each of the relevant points to determine the position and orientation of each of the relevant points of the component physical part in relation to the TFM

Art Unit: 2123

comprises the steps of computing coordinates of the docking position of the TFM on the component physical part; and transforming the coordinates of the relevant points to the coordinates of the TFM using the computed docking position: (As stated by Azar- column 2; and column 3 lines 49-65).

Claim 25. The method of claim 15, further comprising the step of refining the CAD representation before adding the CAD representation to the CAD model: (As stated by Azar: column 2, lines 60-64; and column 3, lines 19-29).

Claim 26. The method of claim 15, further comprising the step of storing the CAD representation of the component physical part in a CAD library: (As stated by Azar: figure 2).

Claim 27. A program storage device readable by a recognition machine, tangibly embodying a program of instructions executable by the machine to perform method steps for generating a CAD (computer-aided design) model of a corresponding physical model comprising a plurality of component physical parts, the method comprising the steps of generating a CAD representation of a given component physical part based on relevant points of the component physical part; tracking coordinates of the relevant points of the CAD representation of the component physical part in relation to coordinates of the CAD model as the physical component part is placed in a desired position in the physical model; and adding the CAD representation of component physical part to the CAD

Art Unit: 2123

model such that the CAD model comprises an ensemble of individual CAD representations of component physical parts: (As stated by Azar: figures 1-2; and column 2, lines 24-41).

Claim 28. The program storage device of claim 27, wherein the instructions for performing the step of generating a CAD representation of the component physical part comprise instructions for performing the steps of obtaining coordinate data for each of the relevant points of the component physical part; processing the coordinate data for each of the relevant points to determine the position and orientation of each of the relevant points of the component physical part in relation to coordinates of a tracker free member (TFM) attached to the component physical part at a docking position on the component physical part: (As stated by Azar: column 2, lines 49-63).

Claim 29. The program storage device of claim 28, further comprising instructions for performing the step of rendering an image of the component physical part attached to the TFM using the processed coordinates: (As stated by Azar: column 2, lines 39-61).

Claim 30. The program storage device of claim 28, wherein the instructions for performing the step of obtaining coordinate data for each of the relevant points of the component physical part comprise instructions for performing the steps of receiving a part identification (ID) code associated with the component physical

Art Unit: 2123

part; and retrieving pre-stored geometry data and docking position data associated with the component physical part based on the part ID code: (As stated by Azar: column 3, lines 19-29).

Claim 31. The program storage device of claim 30, wherein the part ID code is received from one of the TFM or by user input: (As stated by Azar - column 3, lines 19-29).

Claim 32. The program storage device of claim 28, wherein the step of obtaining coordinate data for each of the relevant points of the component physical part comprises the steps of obtaining pre-stored geometry data of the relevant points associated with the component physical part; receiving tracker data from the TFM comprising measured coordinates of a portion of the relevant points of the component part; comparing the measured coordinates with the pre-stored geometry data; computing the docking position of the TFM on the component physical part, if a match is found between the measured coordinates and the geometry data of corresponding relevant points; determining a remainder of the relevant points of the component physical model based on the computed docking position and geometry data: (As stated by Azar.- columns 2 and 3, lines 49- 66 and 19-29 respectively).

Claim 33. The program storage device of claim 32, further comprising instructions for performing the steps of rendering images of the component

Art Unit: 2123

physical part each having an alternative docking position, if a match is not found between the measured coordinates and the geometry data for a user to select the image with a desired docking position: (As stated by Azar: column 2, line; 49-66).

Claim 34. The program storage device of claim 28, wherein the instructions for performing the step of obtaining coordinate data for each of the relevant points of the component physical part comprise instructions for performing the steps of receiving tracker data from the TFM comprising measured coordinates of successive relevant points of the component part; rendering an image of the component physical part, wherein the image is dynamically generated by connecting a line from a current measured point to a last measured point; and re-connecting the line from the current measured point to any previous measured point, in response to a signal sent by the user: (As stated by Azar: columns 1, 2 and 3, lines 34-52, 49- 66 and 19-29 respectively).

Claim 35. The program storage device of claim 28, wherein the instructions for performing the step of processing the coordinate data for each of the relevant points to determine the position and orientation of each of the relevant points of the component physical part in relation to the TFM comprise instructions for performing the steps of computing coordinates of the docking position of the TFM on the component physical part; and transforming the coordinates of the relevant

Art Unit: 2123

points to the coordinates of the TFM using the computed docking position: (As stated by Azar: columns 1, 2 and 3, lines 34-52, 49- 66 and 19-29 respectively).

Claim 36. The program storage device of claim 27, further comprising instructions for performing the step of refining the CAD representation before adding the CAD representation to the CAD model: (As stated by Azar- column 3, lines 19-29).

Claim 37. The program storage device of claim 27, further comprising instructions for performing the step of storing the CAD representation of the component physical part in a CAD library: (As stated by Azar. column 3, lines 19-29).

### ***Conclusion***

8. **THIS ACTION IS MADE FINAL.** Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire **THREE MONTHS** from the mailing date of this action. In the event a first reply is filed within **TWO MONTHS** of the mailing date of this final action and the advisory action is not mailed until after the end of the **THREE-MONTH** shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event, however, will

Art Unit: 2123

the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.
